

I'm not robot

Continue

He will be running rock fishing trips as the weather permits at the end of the month. On the Dungeness crab front there have been no new demoic acid (DA) results posted on the cdph website this week. The only updates have been for Monterey Bay and Channel Island rock crabs. see Dune crab DA DA published for the Bay Area and North Coast Ports (hopefully) on Friday. Captain Rick Powers The New Sea Angler 707-875-3344 OFFSHORE - Sea conditions have been rough and wild for most of the past ten days. Here Tuesday 12-15 we're seeing 15 knots of wind over a 10-foot swell in the Bodega weather buoy. With only 16 days to rockfish season readers will have to watch the weather and leave as soon as conditions permit. For next week the forecast calls for a number of weather systems to move through Thursday, and again late Saturday with the wet pattern continuing into next week. There has been no local DA crab tests done off the Bay Area coast this past week due to strong winds and swell, but we expect the CDPH will have both crabs in the tests and results released later this week. Some recent results were posted on the CDPH page for the Channel Islands and Morro Bay and the results can be found here. We're more interested to see the results of the Bodega Bay dungeness, Ft Bragg and all northern ports. If the weather stays rough and ships can't go out to catch crabs for testing it's likely we won't see any openers until after the New Year. There is a huge wave train moving along the coast here on Thursday 12-10. While we are currently seeing a 17-foot x 14 second period in chief Mendocino's Bodega buoy (6:PM) the swell is currently at 33 feet with a second period of 18. These are not rollers, but three more groundbreaking stories and one of those shows that Mother Nature provides us to show how powerful it can be. This wave train will move south overnight and the forecast calls for waves in the 20-foot low range of the Bay Area coast on Friday. Due to the weather there has only been one home automation acid update from the CDPH so far this week. There seems to be a typo in his chart about the date, but it appears that Fort Bragg's DA levels have climbed again after being in the safe zone in late November. That said if next week's test results confirm that levels of all ports are below 60ppm the protocol that DF&Amp;W said last week that the tests would be conducted weekly. Obviously, testing cannot be done with the current state of ocean conditions. We are reviewing the CDPH site daily and will publish results as they become available. Captain Rick Powers The New Sea Angler 707-875-3344 INSHORE - It's all pretty close to the coast this week. Fishermen are catching Stripers (Lower, Stripes) and Halibut, Pacific closer to the coast of about 60-80 feet of water. Bounce balling is the best technique reported so far Week. There have also been reports of Sharks and Stingray, Round hitting a little further this week. OFFSHORE - Rockfish (Rockfish, copper and rockfish, Vermillion) continue to ignite this week. The bite of the sheep's head is less frequent, but it is still present. The tuna, the Yellowfin bite has died down a bit, but they're still pretty hot 10-20 miles. They are Go after the anchovies on small hooks so far. Look for kelp patties for the best sizes. Bucksport Sporting Goods 707-442-1832 OFFSHORE - Over the long Thanksgiving weekend the weather has settled down and the sacks are stuffed. On Sunday 11-29 Rick, at the New Sea Angler reported 25 rockfish boundaries (Rockfish, Vermillion) to go with 49 Lingcod at 16 pounds. Rick said they had a cold wind of 10 to 15 knots that he normally finds back, but today he didn't do it until late afternoon. The weather allowing Rick is running daily trips this coming week. On the private boat front Billy G reported four boundaries of most blacks (Rockfish, Black) and Blues (Rockfish, Blue) today. Jerry A, from Sacramento, reported rockfish limits and Lings limits to 20 pounds of Ft Ross fishing over the past three days. Crab tests are being done this week off the coast of the Bay Area and we will release updates as soon as the results come out. On Saturday 11-28 Rick on the New Angler del Mar reported 38 Rockfish boundaries and triple-digit Ling at 24 pounds. Rick said they had some offshore wind in the morning, but late in the morning the weather was flat and the Lings were melting. On Friday 11-27 Rick reported 46 Rockfish boundaries adding 84 Lings to 18 pounds. He has been working the northern reefs around Timber Cove at Salt Point and south of Ft Ross last week. BAIT REPORT - There are some Mackerel running and working well for the bait on the ground this week. Captain Rick Powers The New Sea Angler 707-875-3344 OFFSHORE - Ocean conditions have been neglected rough in recent days and few ships have ventured out. Here on Tuesday 11-17 at night we are seeing NW winds of 15 knots over a 10-foot swell. The water time continues to drop with a current time of 54.5 in the winery's weather buoy. These colder times will help decrease any left over the red tide and in turn we should be seeing evidence of cleaner crab domotic acid in the coming weeks. Testing is currently scheduled to take place off the Bay Area Coast from Monday 11-16 to Wednesday 11-18. It takes about a week (a day in government time) to get the crabs in the lab and for the CDPH to release the results. We'll publish any news about crabs as soon as it arrives. Meanwhile, the rockfish and Lingcod action has been excellent and our party boat sponsors can use a few good ones along the lane. The Lingcods have been biting mackerel or whole squid. Regulations can catch up to 170 feet. Fishermen have been taking their limits and not improving. BAIT REPORT - There are some Mackerel running and working well for the bait on the ground this week. The Captain Powers The New Sea Angler 707-875-3344 INSHORE - Ocean conditions have been neglected in recent days and few ships have ventured out. Here on Tuesday 11-17 at night we are seeing NW winds of 15 knots over a 10-foot swell. The water time continues to drop with a current time of 54.5 in the winery's weather buoy. These time will help decrease any left over the red tide and in turn we should be seeing evidence of cleaner crab demoic acid in the coming weeks. Testing is currently scheduled to take place off the Bay Area Coast from Monday 11-16 to Wednesday 11-18. It takes about a week (a day in government time) to get the crabs in the lab and for the CDPH to release the results. We'll publish any news about crabs as soon as it arrives. Meanwhile, the rockfish and Lingcod action has been excellent and our party boat sponsors can use a few good ones along the lane. The weather increased and the ocean was not accessible due to high swells and winds. Friday's swell jumped from 6 to 12 feet longer for Saturday before the approaching weather front. Here on Sunday 11-15 in the afternoon we are seeing NW winds of 28 knots over a 15-foot swell. Winds and waves will decrease until Monday and it looks like Wednesday fishermen on larger boats will be able to leave again. These winds and swells are also helping to swell local waters and drop the water time we expect to make for clean crab testing sooner rather than later. Water time should fall slowly in the days before and a neglected ocean is just what it takes to help clean up the last of these seaweed flowers. We will publish updated fishing reports as the ships detach from new Angler del Mar captain Rick Powers 707-875-3344
